

MODEL 307-1P

Magnetic Card Reader

The model 307-1P magnetic card reader is a low cost, high quality access control device which is used primarily to control access to restricted areas where an electronic or computerized system is not needed. When the correct, durable coded plastic card is inserted into the card reader, a switch is activated. This switch can trigger automatic gates, electric door strikes and other access control devices.

The model 307-1P does not require power to operate. The code is changed simply by changing a code card in the card reader. Crossover code cards may be used to allow two different codes to operate simultaneously.

ACCESS CARDS

Model V-4 access cards are credit card size (2-1/8" X 3-3/8") and made of plastic with an inner magnetic core. Custom printing and sequential numbering are available.
